

# Styling DOM Elements

## Via style Property

Directly target individual CSS styles (on the element)

Controls styles as inline styles on the element

Style property names are based on CSS properties but have adjusted names (e.g. backgroundColor)

## Via className

Directly set the CSS classes assigned to the element

Set/ Control all classes at once

You can also control the id or other properties

## Via classList

Conveniently add, remove or toggle CSS classes

Fine-grained control over classes that are added

Can be used with className (with care)
