

Attributes vs Properties

Often (but not always!), attributes are mapped to properties and “live synchronization” is set up.

```
<input id="input-1" class="input-default" value="Enter text...">
```

Attributes (placed in HTML code, on element tags)

const input

1:1 mapping (+ live-sync)

input.id

Different names (but live-sync)

input.className

1:1 mapping (1-way live-sync)

input.value

MDN for full reference of available properties + their behavior!

Properties (automatically added on created DOM objects)
